AI Infrastructure Engineer

Location: Remote
Employment Type: Full-Time

About the Role

We're looking for an experienced AI Infrastructure Engineer to design, build, and scale the platforms that power our AI/ML workloads. In this role, you'll own the systems that train, serve, and monitor models in production from GPU clusters and distributed training pipelines to high-throughput inference services. You thrive at the intersection of systems engineering, cloud infrastructure, and modern ML tooling.

What You'll Do

- Design and build scalable infrastructure for model training, fine-tuning, and inference across CPU and GPU clusters
- Architect distributed training pipelines and optimize multi-node, multi-GPU workloads
- Build and operate low-latency, high-throughput model serving platforms with autoscaling and observability
- Collaborate closely with Engineering, Researchers, and Product teams to productionize models and reduce iteration time
- Own the platform layer for orchestration, scheduling, and resource management (Kubernetes, Ray, or similar)
- Drive technical decisions, code reviews, and best practices for reliability, cost, and performance across the stack
- Identify and resolve bottlenecks in training throughput, inference latency, GPU utilization, and data pipelines
- Mentor engineers and help elevate the team’s craft around large-scale ML systems
- Participate in sprint planning, retrospectives, and cross-functional discussions

What We're Looking For

Must-Have

- 2+ years of professional software / infrastructure engineering experience, with significant time on Infra or data platforms
- Deep expertise building and operating distributed systems in production on orchestration, scheduling, and storage
- Strong proficiency in Python and at least one systems language (Go, Rust, or C++)
- Solid understanding of GPU computing fundamentals: CUDA, memory hierarchy, parallelism, and accelerator economics
- Hands-on experience with container orchestration (Kubernetes) and infrastructure-as-code (Terraform, Pulumi, or similar)
- Familiarity with distributed training frameworks (PyTorch DDP/FSDP, DeepSpeed, Megatron, or Ray Train)
- Experience with CI/CD pipelines, observability tooling (Prometheus, Grafana, OpenTelemetry), and modern deployment workflows
- Strong sense of ownership, attention to detail, and ability to work independently in a remote environment

Nice-to-Have

- Experience operating LLM inference at scale (KV cache management, batching, speculative decoding, quantization)
- Background in performance engineering on profiling, kernel optimization, or compiler stacks (Triton, TVM, XLA)
- Familiarity with major cloud platforms (AWS, GCP, or Azure) and their ML-specific services
- Experience with feature stores, vector databases, or large-scale data pipelines (Spark, Ray Data, Beam)
