ML Ops Engineer

About Us:

Founded in 2016, DataZymes is a next-generation analytics and data science company driving technology and digital-led innovation for our clients, thus helping them get more value from their data and analytics investments. Our platforms are built on best-of-breed technologies, thus protecting current investments while providing clients more bang for their buck. As we are a premier partner formany Analytics and Information Management companies, we also provide advisory and consulting services to clients helping them make the right decisions and put together a long-term roadmap.
Our mission at DataZymes is to scale analytics and enable healthcare organizations in achieving non- linear, long term and sustainable growth. In a short span, we have built a high-performance team in focused practice areas, built digital-enabled solutions, and are working with some marquee names inthe US healthcare industry.

Job Location: Bengaluru
Experience Required: 3 – 5 Years
Industry: Pharmaceutical / Life Sciences

About the Role:

This is a hands-on ML Ops engineering role responsible for building, deploying, and operating production-grade machine learning systems. The engineer owns the full ML lifecycle: from pipeline design and model training infrastructure through deployment, monitoring, and continuous optimization. The role is client-facing, embedded within pharma and life sciences data science teams, and requires the maturity to operate independently in complex delivery environments. The expectation is not prototyping delivery. It is reliable, observable, production systems that hold up under real operational conditions.

Required skills & Qualifications:

- 3-5 years of hands-on MLOps or ML engineering experience in production environments
- Strong Python programming with software engineering discipline (versioning, testing, modular code)
- Experience designing and operating end-to-end ML pipelines, from feature engineering through model serving
- Proficiency with containerization and orchestration: Docker, Kubernetes
- CI/CD implementation for ML workflows, model versioning, and experiment tracking (MLflow or equivalent)
- Experience building both real-time and batch inference systems with API exposure
- Working knowledge of PyTorch or TensorFlow
- Cloud ML services experience on AWS or GCP
- Strong data engineering fundamentals: pipeline design, data quality, schema management

Preferred Skills:

- Experience operating within large, multi-team data science organizations
- Familiarity with Databricks or Snowflake as compute and storage platforms
- Knowledge of responsible AI practices: model explainability, bias detection, fairness monitoring
- Experience with distributed training and large-scale model serving
- Exposure to model governance and validation frameworks in regulated industries

What Success Looks Like:

- ML models ship to production on schedule and remain stable under operational load
- Inference latency and infrastructure cost targets are met and maintained
- Model performance is continuously monitored; drift is detected and escalated before it affects outputs
- CI/CD pipelines reduce manual deployment effort and eliminate environment inconsistencies
- The team spends less time firefighting infrastructure and more time building.
